Election/Restrictions

Applicant's election of claims 1-14 in Paper No. 7 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)). Applicant's request of a rejoinder under MPEP 821.04 will be applied when appropriate.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

Claims 1-2, 4-5, 7-9, 11-12, and 14 are rejected under 35 U.S.C. 102(a) as being anticipated by Palagonia (5,874,782). Palagonia discloses an electronic component, comprising: an electronic circuit (Fig.3A el.36) having a first surface; electrical contacts (el.40) at least on said first surface for electrical bonding of said electronic circuit; at least one elevation (el.32) disposed on said first surface, said at least one elevation having an elevation surface and an interior and a contact zone, said at least one elevation being formed of an insulating material having sufficient flexibility to absorb stresses occurring in said contact zone as a result of at least one of the group

consisting of thermal loading and mechanical loading (col.5 lines 305); at least one of said electrical contacts (el.34) disposed on said at least one elevation; and a conduction path (el.44) disposed on said elevation surface between said at least one of said electrical contacts and said electronic circuit. Palagonia also discloses an elastic insulating layer (el.42) at least partially covering said first surface and adjoining said at least one elevation; and conductor runs (el.44) disposed on said insulating layer and forming a conducting connection between said at least one elevation and said electronic circuit; wherein the electronic component is a semiconductor component (col.4 lines 46-48); and wherein at least one of said electrical contacts is formed by one of the group consisting of a conducting layer, a conducting pin, and a conducting ball (col.5 lines 17-28).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 3 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Palagonia as applied to claims 1-2, 4-5, 7-9 above, and further in view of Chen et al. (5,910,687). Palagonia does not disclose an insulating layer at least partially covering said at least one elevation. However, Chen discloses an insulating layer at least partially covering said at least one elevation (Fig.11 el.321). Therefore, it would have

Art Unit: 2813

been obvious to a person skilled in the art at the time of the invention to use the insulating layer of Chen with the electronic component of Palagonia in order to increase the reliability of the contact layer (col.10 lines 43-54).

Claims 6 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Palagonia as applied to claims 1-2, 4-5, 7-9, and 11-12 above, and further in view of Lee et al. (6,140,456). Palagonia does not disclose a polymer component. However, Lee discloses wherein the electronic component is a polymer component (col.1 lines 25-31; col.4 lines 29-42). Therefore, it would have been obvious to a person skilled in the art at the time of the invention to use the polymer component of Lee with the electronic component of Palagonia in order to form a thin film of material with a low dielectric constant (col.4 lines 35-42; col.5 lines 24-42).
